Socket TCP

Echo Application

Std Input

Std Output

Echo Client (1)

```
import java.net.*;
import java.io.*;

public class EchoClient {
    public static void main(String[] args) throws IOException {

        /* Lanciando il programma senza argomenti si ottiene il local loopback IP address,
           per testarlo in locale (client e server sulla stessa macchina), altrimenti
           si possono passare da linea di comando l'indirizzo o il nome della macchina remota */

        InetAddress addr;
        if (args.length == 0) addr = InetAddress.getByName(null);
        else addr = InetAddress.getByName(args[0]);
        Socket socket=null;
        BufferedReader in=null, stdIn=null;
        PrintWriter out=null;
        try {
            // creazione socket
            socket = new Socket(addr, EchoServer.PORT);
            System.out.println("EchoClient: started");
            System.out.println("Client Socket: " + socket);
```

Echo Client (2)

```
// creazione stream di input da socket
InputStreamReader isr = new InputStreamReader( socket.getInputStream());
in = new BufferedReader(isr);

// creazione stream di output su socket
OutputStreamWriter osw = new OutputStreamWriter(socket.getOutputStream());
BufferedWriter bw = new BufferedWriter(osw);
out = new PrintWriter(bw, true);

// creazione stream di input da tastiera
stdIn = new BufferedReader(new InputStreamReader(System.in));
String userInput;
```

Echo Client (3)

```
// ciclo di lettura da tastiera, invio al server e stampa risposta
while (true){
    userInput = stdIn.readLine();
    out.println(userInput);
    if (userInput.equals("END")) break;
    System.out.println("Echo: " + in.readLine());
}
}catch (UnknownHostException e) {
    System.err.println("Don't know about host " + addr);
    System.exit(1);
} catch (IOException e) {
    System.err.println("Couldn't get I/O for the connection to: " + addr);
    System.exit(1);
}
System.out.println("EchoClient: closing...");
out.close();
in.close();
stdIn.close();
socket.close();
}
} //EchoClient
```

Echo Server (1)

```
public class EchoServer {  
    public static final int PORT = 1050; // porta al di fuori del range 1-1024 !  
  
    public static void main(String[] args) throws IOException {  
        ServerSocket serverSocket = new ServerSocket(PORT);  
        System.out.println("EchoServer: started ");  
        System.out.println("Server Socket: " + serverSocket);  
        Socket clientSocket=null;  
        BufferedReader in=null;  
        PrintWriter out=null;  
        try {  
            // bloccante finchè non avviene una connessione  
            clientSocket = serverSocket.accept();  
            System.out.println("Connection accepted: "+ clientSocket);  
            // creazione stream di input da clientSocket  
            InputStreamReader isr = new InputStreamReader(clientSocket.getInputStream());  
            in = new BufferedReader(isr);  
            // creazione stream di output su clientSocket  
            OutputStreamWriter osw = new OutputStreamWriter(clientSocket.getOutputStream());  
            BufferedWriter bw = new BufferedWriter(osw);  
            out = new PrintWriter(bw, true);  
        } catch (IOException e) {  
            e.printStackTrace();  
        } finally {  
            if (clientSocket != null) {  
                try {  
                    clientSocket.close();  
                } catch (IOException e) {  
                    e.printStackTrace();  
                }  
            }  
        }  
    }  
}
```

Echo Server (2)

```
//ciclo di ricezione dal client e invio di risposta
while (true) {
    String str = in.readLine();
    if (str.equals("END")) break;
    System.out.println("Echoing: " + str);
    out.println(str);
}
catch (IOException e) {
    System.err.println("Accept failed");
    System.exit(1);
}
// chiusura di stream e socket
System.out.println("EchoServer: closing...");
out.close();
in.close();
clientSocket.close();
serverSocket.close();
}
} // EchoServer
```
